

1. Power Automate

1.1 Pre-Trained Model

1. Trigger: **When a file is created** (OneDrive)
2. **AI Builder – Extract information from invoices** (pre-trained)
3. **Add a row** to Excel/Table (mapping AI Builder outputs directly)

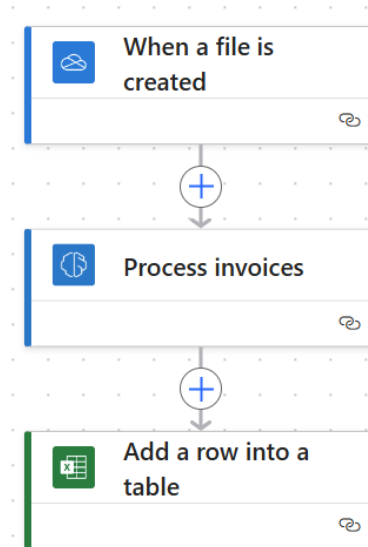

Figure 1- Workflow that used Pre-Trained Model

1.2 Custom-Trained Model

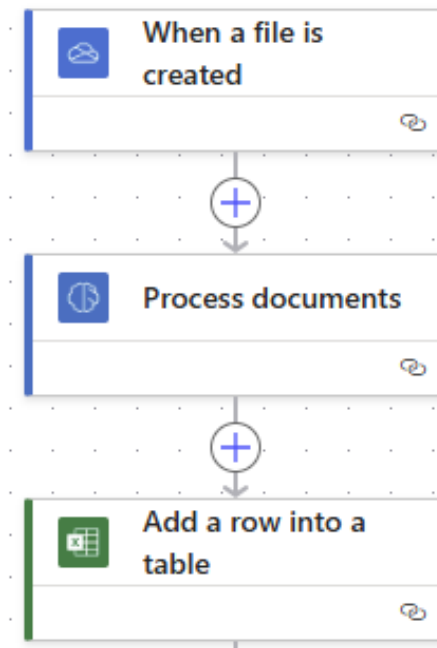

Figure 2- Workflow that used Custom-Trained Model

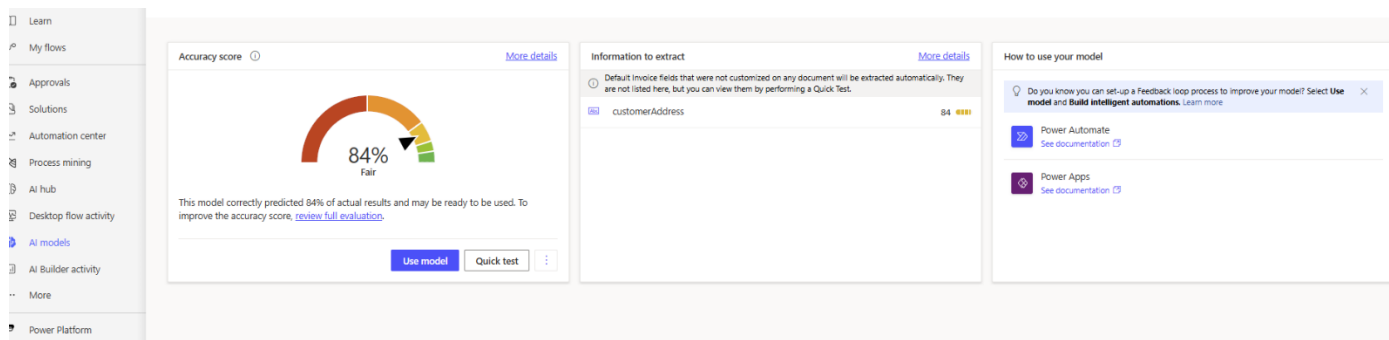

Figure 3- Accuracy Score of Custom Trained Model

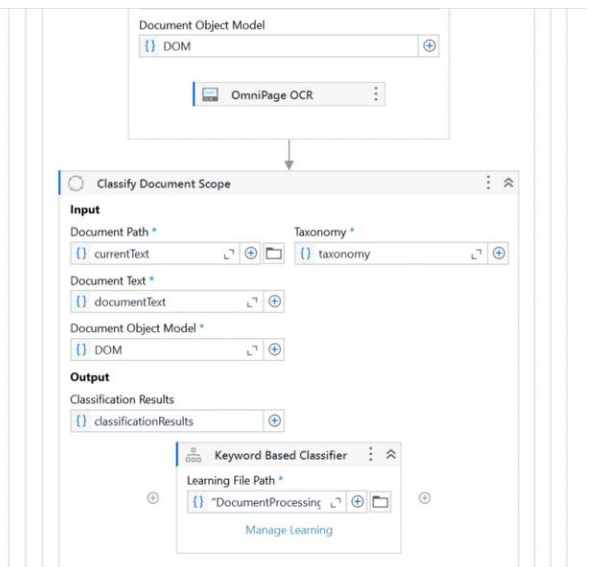

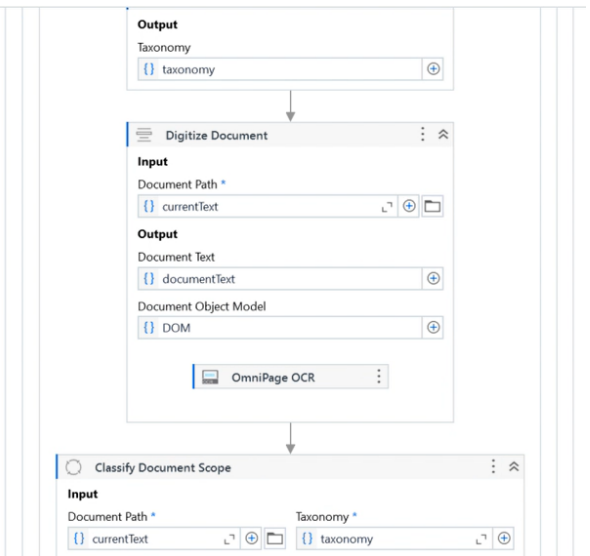

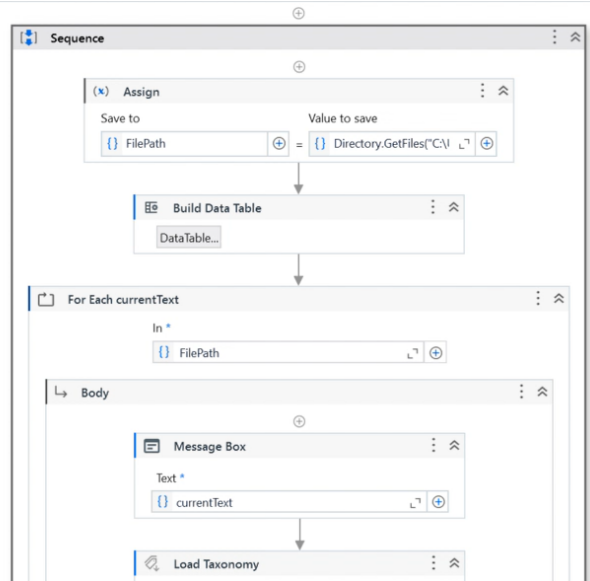

1.3

2. UiPath

1. Assign (folder path)
2. Build DataTable
3. For Each file in folder
4. Load Taxonomy
5. Digitize Document (OmniPage OCR)
6. Classify Document Scope
7. Keyword Based Classifier
8. Data Extraction Scope
9. Machine Learning Extractor (pre-trained invoice model)

Note: in case of custom trained model, just in this step that model was used

10. Export Extraction Results
11. Merge Data Table
12. Write Range (workbook)

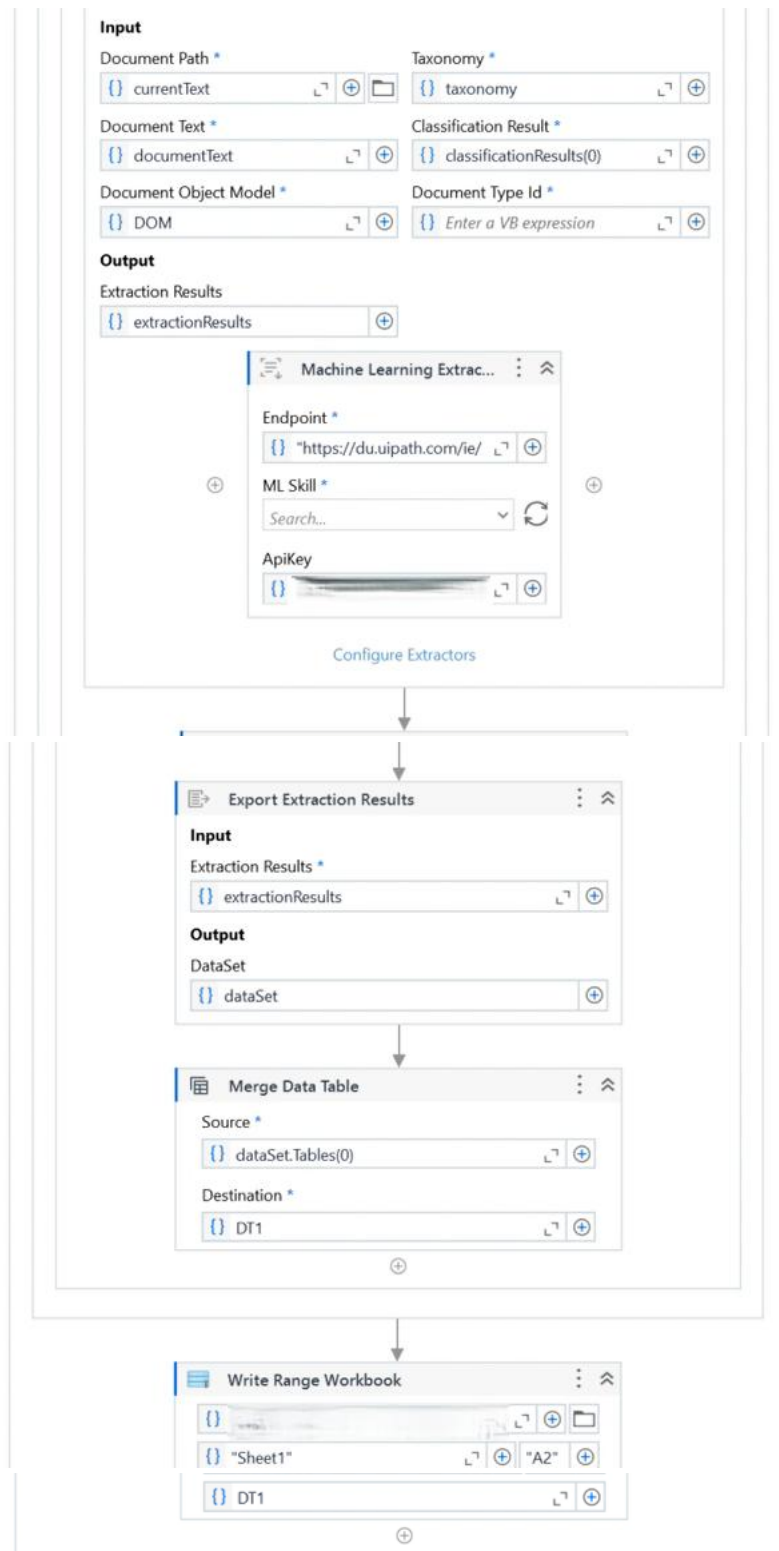

Figure 4- Actual Workflow in UiPath

Figure 5- Flow Chart of workflow in UiPath

3. MAKE.COM

1. Gmail - Watch emails (trigger)
2. Gmail - Get attachment
3. Iterator
4. AI Document Extractor (pre-trained)
5. Google Sheets - Add row

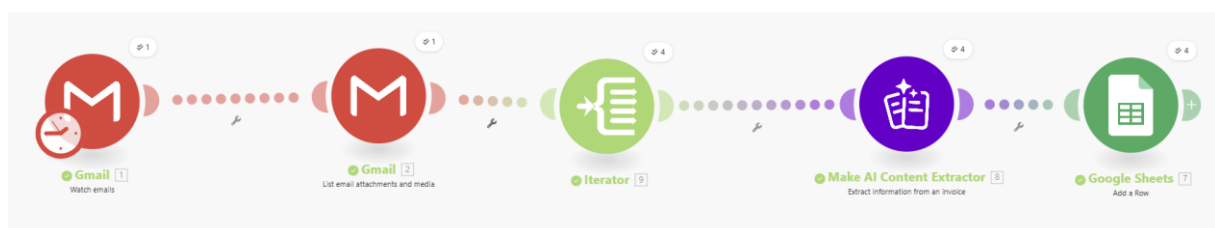

Figure 6- Workflow in Make

4. N8N

1. **Trigger:** Google Drive (fileCreated)
2. **Download file:** Retrieve binary data from Google Drive
3. **Extract from File:** Parse PDF content into text/binary
4. **Edit Fields:** Manual data transformation/mapping
5. **Message a model:** AI Extraction (OpenAI/LLM node)
6. **Code in JavaScript:** Custom data cleaning/formatting
7. **Append row in sheet:** Data export to Google Sheets

Number of Steps: 7

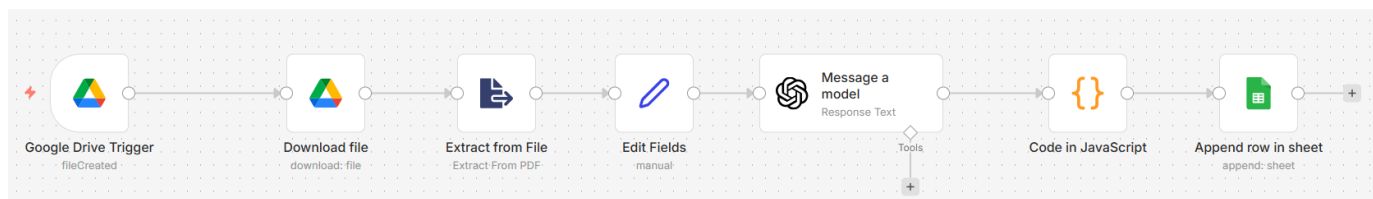

Figure 7- Workflow in n8n

5. Python- Code

Note: Two separate .py files have been uploaded in repository with name Local_LLM.py and cloud_LLM.py.
